CRYSTALLOGRAPHIC REFINEMENT

LEAST SQUARES **MINIMIZATION**

$$\Sigma_{\mathbf{H}} \; (I_{\mathbf{H\,calc}} - I_{\mathbf{H\,obs}})^2 \; / \; \sigma_I^2$$

$$+ \quad \Sigma_r \; (\boldsymbol{R}_{\mathbf{calc}} - \boldsymbol{R}_{\mathbf{target}})^2 \; / \sigma_{\mathbf{r}}^2$$

H reflections (h,k,l) I_H Intensity

R restraints (stereochemistry: distances, angles,

thermal motion, charge density similarity, targets for κ & κ' …)

Least Squares Minimisation

1 refinement cycle : `solve`

A dP = V `normal equations`

$$V_p = \Sigma_{\mathbf{H}}\ w_{\mathbf{H}}\ (I_H^{obs} - I_H^{calc})\ \frac{\partial I_{\mathbf{H}}^{calc}}{\partial p}$$ `gradient`

Normal Matrix

$$A_{pq} = \Sigma_{\mathbf{H}}\ w_{\mathbf{H}}\ \frac{\partial I_{\mathbf{H}}^{calc}}{\partial p}\ \frac{\partial I_{\mathbf{H}}^{calc}}{\partial q}$$

Solve normal equations

$$A \; dP = b$$

matrix inversion $dP = A^{-1} b$

conjugate gradients iterative method

$dP_0 \rightarrow dP_1 \rightarrow \ldots \rightarrow dP_n$

► Useful for Large systems (sparse matrix)

Normal Matrix INVERSION

$$dP = A^{-1} V$$

B = A^{-1} matrix of (variance , covariance)

$$B_{pp} \cdot Z = \mathrm{VAR}(p) = \sigma^2(p)$$

$$B_{pq}\, Z = \mathrm{COV}(p,q) = \sigma(p)\ \sigma(p)\ \rho(p,q)$$

$$Z = \Sigma_H\ W_H(I_{obs}-I_{calc})^2/(N_{obs}-N_{var})]^{1/2}$$

goodness of fit

Binary correlation coefficient parameters *p* & *q*

$$\rho_{p,q} = \frac{B_{pq}}{(B_{pp}B_{qq})^{1/2}}$$

Gradient lines

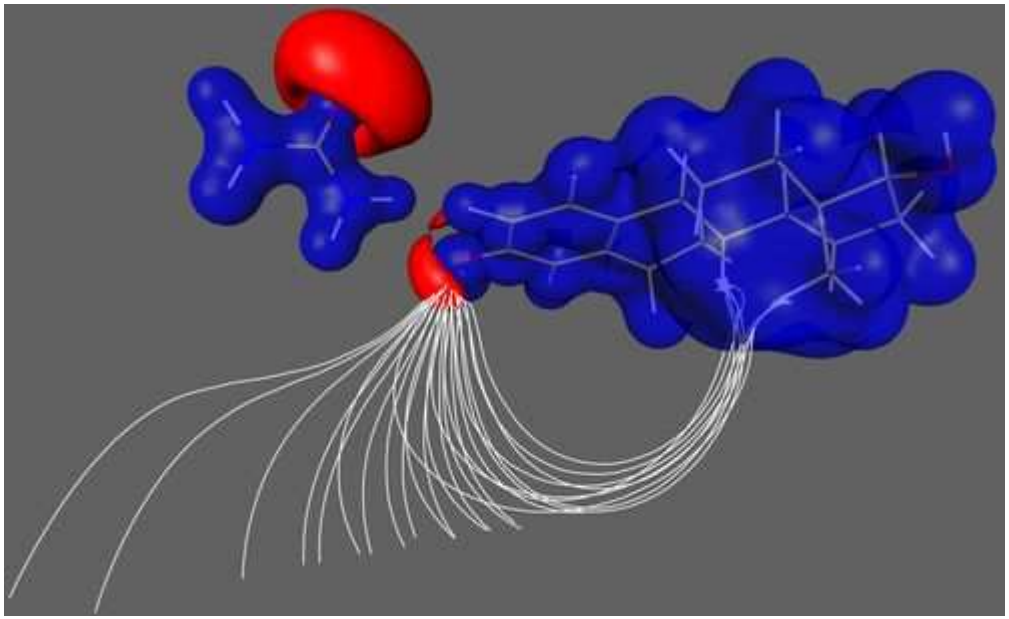
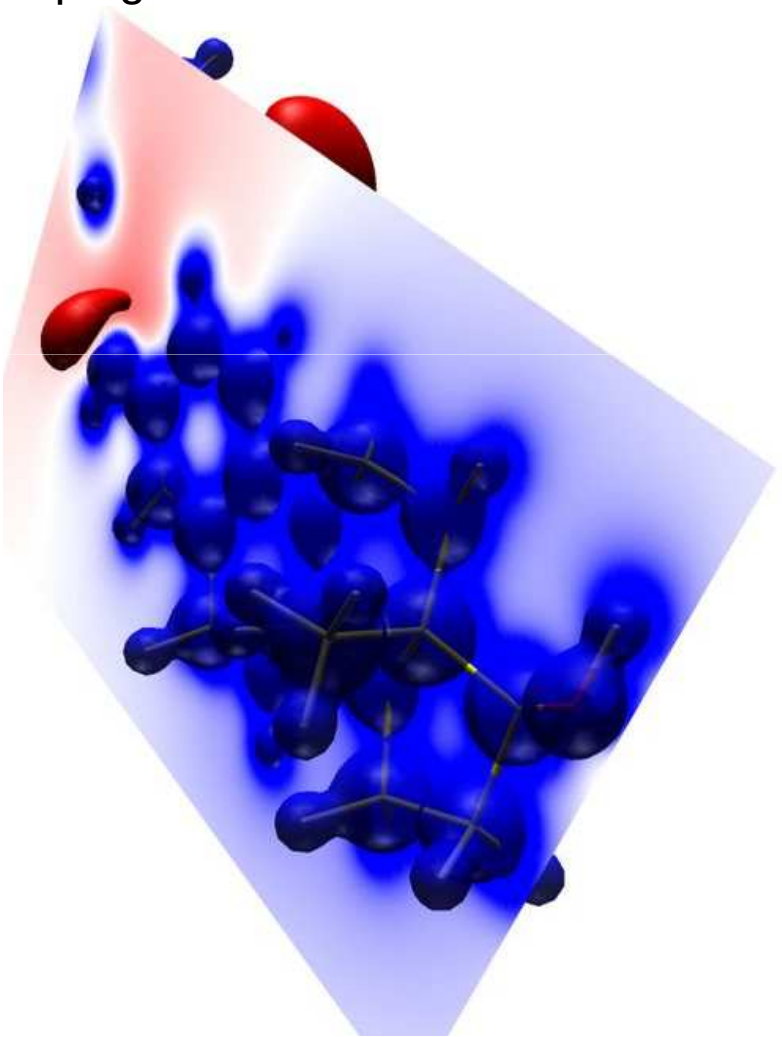
MoProViewer : a graphical layer for MoPro

(Benoît Guillot)

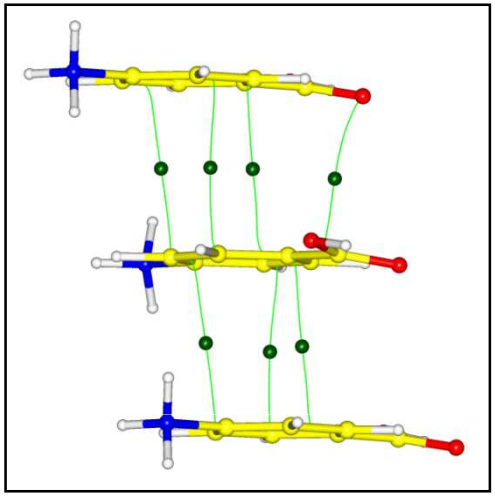
- Reads MoPro (and other) file formats
- Easy and graphically aided 2D / 3D VMoPro maps generation
- Classical functionalities of molecular viewer :
    - lines, sticks, ball & sticks representations
    - stereochemistry computation
- Maps representations :
    - iso-surfaces
    - gradient lines
    - 2D slices

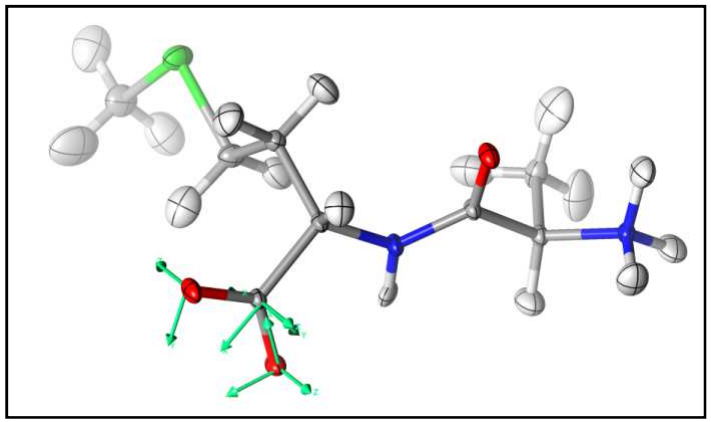




Some other examples of MoProViewer capabilities :

Carboxyphenylammonium stacking with C-C interactions bond paths and their (3,-1) critical points shown as green spheres





AlaMet molecule with 50% probability thermal ellipsoids, and orthogonal atomic axis systems represented for the COO atoms

AlaMet molecule with a plane showing a slice of the electrostatic potential in the COO plane (left), and its corresponding 2D contour map (right).

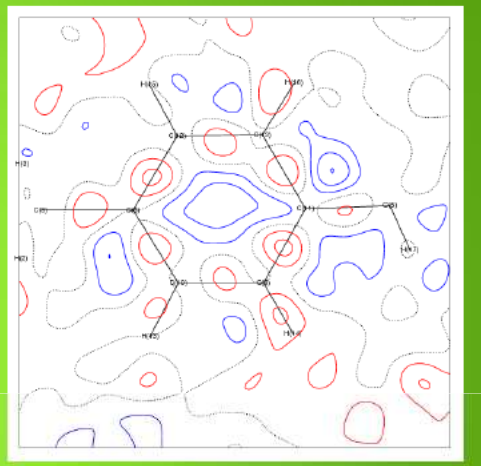
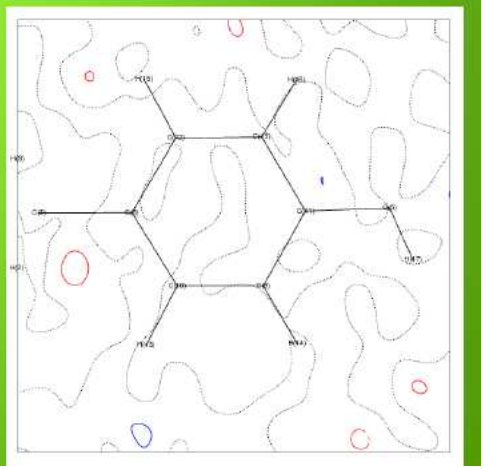
Refinements of experimental X-ray data

Application of the databanks to low-resolution data (transferred aspherical atom model refinement, TAAM):

- significantly **lowers** the conventional **R-factor** (1% or more)
- **improves** the determination of **bonds** and **angles** to within 0.002-0.003 Å and 0.09-0.17° of values obtained from a complete multipolar refinement of high-resolution datasets
- **improves** the determination of **phase** angles by 2-6° compared to the standard independent atom refinement (IAM)
- **removes** majority of the bonding features from the **residual** Fourier difference maps
- **improves** atomic **displacement parameters** (ADPs) and results of the Hirshfeld rigid-bond test

Volkov et al Acta Cryst D, 2007, D63, 160





Main applications of the databases published so far

- Electron Density Transfer & Refinement of small molecules

- increasing precision of the refined Flack parameter (Dittrich, Strumpel *et al.*, 2006)

- used as a starting point in refinement of the constrained multipolar parameters of Proteins (Jelsch *et al.,* 2000; Guillot *et al*., 2008)

- calculation of the electrostatic interaction energy (Li *et al.*, 2006; Dominiak *et al.*, 2007; Dominiak *et al.*, 2009; Fournier *et al.*, 2009)

- modelling of ED of disordered groups & detecting disorder (Dittrich *et al.*, 2007; Bąk *et al.*, 2009; Dittrich, Warren *et al.*, 2009)

- calculation of electrostatic potential of macromolecules (Muzet *et al.*, 2003; Liebschner *et al.*, 2009; Dittrich, Weber *et al*., 2009; Dittrich *et al.*, 2010

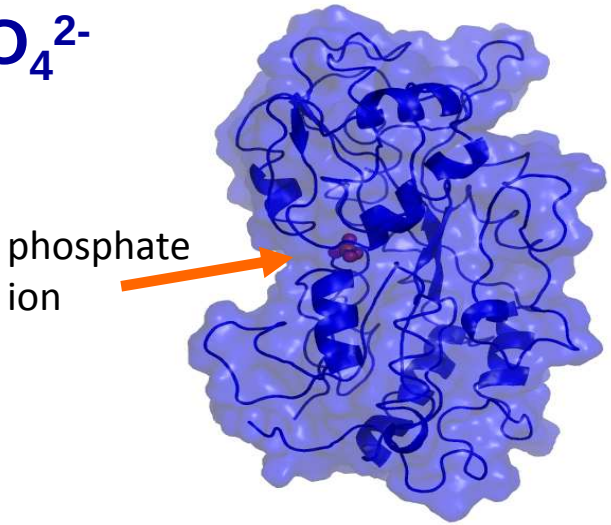
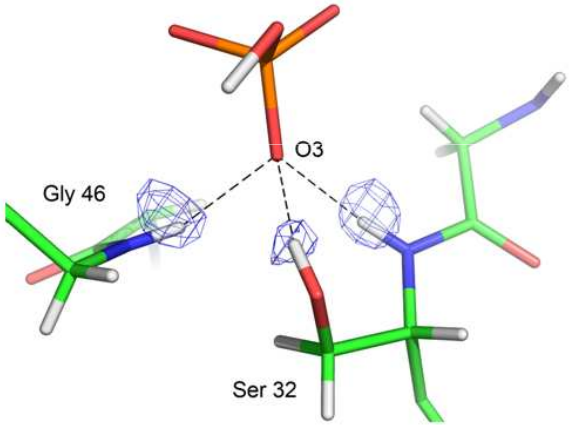
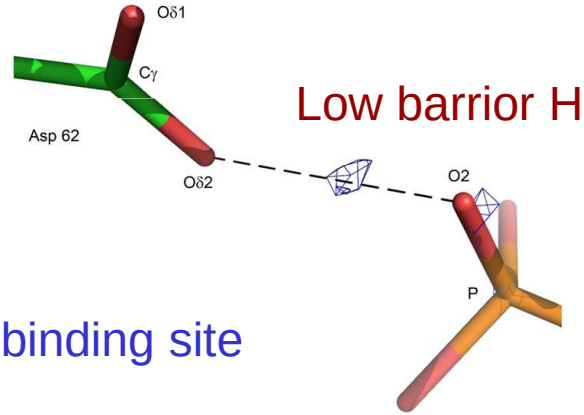
ELUCIDATION OF PHOSPHATE HPO_4^{2-} BINDING to PfluDING PROTEIN







Low barrior H-bond

H atoms
Visible in binding site

PfluDING is a bacterial protein isolated from *Pseudomonas fluorescens.*
The three-dimensional structure was obtained at sub-Ångstrom resolution (0.88Å and 0.98Å) at two different pH (4.5 and 8.5).

ELUCIDATION of PHOSPHATE HPO_4^{2-} BINDING to PfluDING PROTEIN

Contrary to previous theories on phosphate binding proteins,
ELMAM multipolar database electrostatic potential calculations show that the binding cleft has a positive electrostatic potential

The PfluDING structures reveal that the protein is specific for the dibasic form of phosphate (notably HPO_4^{2-} vs. SO_4^{2-}).
